

## Emergency Inbox.

### Guaranteed access to email that helps keep your business running.

**What happens when you cannot get your email?** When some part of your network fails such as a server or your broadband connection, the first impact to you is normally your email. A few minutes without email may be okay but what about a few hours or a few days? Very few organisations are prepared for some element of their infrastructure failing and having a robust business continuity plan in place can be very costly.

With Maildistiller you have, at no extra cost, an Emergency Inbox for just these circumstances. Maildistiller guarantees that if for any reason a message cannot be delivered, you can access it instantly and securely via any web connection. Access your queuing email via a web mail client with the ability to read, forward, reply, open attachments and keep your business running.

Whilst other Email Continuity systems only activate when an action is taken after a disaster, Maildistiller's Emergency Inbox is always on and always available.

When email is unable to reach its destination server Maildistiller's Emergency Inbox makes the email instantly available via a webmail client. **No fuss, no urgent calls.**

The service enables inbound and outbound email to be available from secure data centres to end users. The webmail client allows users to send and receive email from any browser from any internet connection worldwide, ensuring that important communication is not lost during an email server outage situation.

With access to off-site webmail, end users may also use this to respond to the mail as they would normally, allowing business to continue unheeded via email.

**With no additional hardware, no software and no change to email address required, it's business as usual with Maildistiller.**

**Maidistiller's  
Emergency Inbox  
allows you to access  
your email even when  
a network or server  
failure occurs.**

We guarantee that if for any reason a message cannot be delivered, you can access your email instantly and securely via any web connection - always on and always available.
